

Software Engineer - Telemetry Router (m/f/d)

Our **Central Services Platform** division, specifically the **Telemetry Router** service, is dedicated to ensuring secure, compliant, and reliable routing of all critical event and telemetry data in the cloud. To ensure our sovereign cloud services are not just powerful but also transparent and auditable, we are building a cutting-edge **Telemetry Router**, based on the open-source **Vector framework**.

We are looking for an engineer who thinks OTLP is more than just one of the standards — someone who doesn't just build services, but ensures every event is collected, transformed, and delivered with integrity. You will be instrumental in implementing the routing and transformation logic across our distributed infrastructure to provide a single, trustworthy source of truth for all STACKIT workloads.

Your Tasks

- You design and develop the **Telemetry Router** as a sovereign cloud service, focusing on high-volume data collection, transformation, and secure routing (Sources, Transforms, and Sinks).
- You extend our system architecture by identifying and implementing relevant open-source projects (e.g., OpenTelemetry) to capture logs, metrics, and traces, ensuring their seamless flow through the router.
- You develop Kubernetes operators to automate the life cycle of the Telemetry Router service and its configuration.
- You develop and maintain REST APIs that allow our customers to programmatically access and control their telemetry routing and data transformation lifecycles.
- You take ownership in an agile "You Build It - You Run It" environment, acting as a bridge between development and SRE.
- You conduct complex data flow and pipeline analyses to ensure data integrity and compliance, identifying bottlenecks and implementing sustainable fixes in the router.

Your Profile

- You have deep enthusiasm for Software Engineering, Cloud-Native Observability, Data Pipelining, and SRE.
- You actively own the entire software development lifecycle, go and k8s being your bread and butter - k8s operators preferably also a part of your arsenal.
- You are experienced with - or eager to master - the **Vector framework** and high-performance data transformation.
- You understand the security, auditing, and compliance needs of event data in today's cloud environment services.
- You enjoy discovering new technologies (e.g. OpenTelemetry) and are excited about sharing your knowledge with the community and the team.
- You don't just look at dashboards; you understand the underlying telemetry data structures and how to optimize the routing for integrity and cost-efficiency.
